## Introduction

- Backgrounds

- Soybean oil

- Historical prices background - soybean oil

- Bitcoins

- Historical prices background - Bitcoins

## Statistical test on the markets

- Push-response test - Soybean oil

- Push-response test - Bitcoins

- Variance-ratio test

## Backtesting

- Methodology

- Trade results - Soybean oil

- Trade results - Bitcoin

- The End

## What are futures?

- ▶ A futures contract is a binding agreement between a seller and a buyer to make (seller) and to take (buyer) delivery of the underlying commodity (or financial instrument) at a specified future date with agreed upon payment terms.
- ▶ Futures contracts protect suppliers and producers from price changes.
  - ▶ For example, a corn farmer and a cereal company may enter into a futures agreement to lock in a price for a future delivery of corn in a particular month.

## What do we know about soybean oil?

- ▶ Chemicals from soybean oil are used for high cholesterol. Soybean oil is also used as a mosquito repellent and as a nutritional supplement in intravenous feedings.
- ▶ Due to rising biodiesel purchases, the soybean oil demand as a feedstock has also seen a pickup
- ▶ The oil is produced from the seeds of the soybean plant

## Historical prices - soybean oil

## Summary statistics - soybean oil

Soybean Oil Historical Data	
Average Daily Price Change	\$0.01
Standard Deviation of Daily Price	\$0.32
Average Price of Soybean Oil	\$37.76
Max Price (31 August 2011)	\$58.92
Min Price (16 March 2020)	\$24.99
Max Daily Price Increase	\$2.50
Max Daily Price Decrease	(\$2.65)

## What happened?

- ▶ **Global Soybean Oil Market Outlook:** The industry is currently being driven by increasing demand of soybean meal for livestock products which has, thus, contributed considerably to the rise in soy oil production and rising demand of soybean oil. Other advantages such as easy availability, competitive prices, environment-friendly and various nutritional benefits of soy oil are the factors that are stimulating its consumption.
- ▶ **The impact of COVID-19 on global soybean oil market:** consumer focus has shifted toward the consumption of nutrient-rich food items for boosting immunity, such as soybean oil, which is projected to act favorably for market growth. However, the lockdowns imposed by governments to curb the spread of the pandemic have disrupted the global soybean trade, in turn, influencing the import and export scenario for the soybean oil market.

## What do we know about Bitcoins?

- ▶ Each bitcoin is a computer file stored in a digital wallet on a computer or smartphone.
- ▶ Blockchain: Bitcoin is powered by open-source code, creates a shared public ledger. Each transaction is a “block” that is “chained” to the code, creating a permanent record of each transaction.
- ▶ Private and public keys: A bitcoin wallet contains a public key and a private key, which work together to allow the owner to initiate and digitally sign transactions, providing proof of authorization.
- ▶ Bitcoin miners: Miners — or members of the peer-to-peer platform — then independently confirm the transaction using high-speed computers, typically within 10 to 20 minutes. Miners are paid in bitcoin for their efforts

## Why is Bitcoin popular?

- ▶ Private, secure transactions anytime — with fewer potential fees.
  - ▶ you can transfer them anytime, anywhere, reducing the time and potential expense of any transaction. don't contain personal information like a name or credit card number, which eliminates the risk of consumer information being stolen for fraudulent purchases or identity theft.
- ▶ The potential for big growth.
  - ▶ Investors bet that once Bitcoin matures, greater trust and more widespread use will follow, and therefore Bitcoin's value will grow.
- ▶ The ability to avoid traditional banks or government intermediaries. It is outside the control of regular banks, governing authorities or other third parties

## How is it different to a traditional currency?

- ▶ Bitcoin created a new category and has the network effect as a result.
- ▶ The main difference is the traditional currency is a centralized system and bitcoins are decentralized one and peer-peer systems. Both the bitcoins and fiat currency have values which can be used for buying and selling of goods in the market.
- ▶ How to get a Bitcoin?
  - ▶ Cryptocurrency exchanges: Coinbase
  - ▶ Investment brokerages: Robinhood
  - ▶ Bitcoin ATMs.
  - ▶ Peer-to-peer purchases: from other bitcoin owner
  - ▶ Bitcoin mining: technical expertise required and computer cost puts this option out of reach for most

# Historical prices - Bitcoins

## Summary statistics - Bitcoins

Bitcoin to USD Historical Data	
Average Daily Price Change	(\$23.82)
Standard Deviation of Daily Price Change	\$502.52
Average Price	\$6,711.56
Max Price (13 March 2021)	\$61,243.09
Min Price (14 January 2015)	\$178.10
Max Price Increase	\$5,380.50
Max Price Decrease	(\$7,309.64)

Bitcoin is a highly volatile instrument that has experienced tremendous price movements over the years, sometime gaining hundreds of percentage points or crashing significantly over a relatively short period of time. While it is less affected by happenings in mainstream markets, it can be affected by a variety of factors relating to crypto space, the blockchain industry and by regulatory issues.

=====						

## Interpretation

- ▶ Recall that for a Levy's distribution:

$$\log_{10}(\sigma) = \alpha + \beta \log_{10}(\tau) \Rightarrow \sigma = 10^{\alpha} \times \tau^{\beta}$$

- ▶ Here we have computed the coefficients that  $\alpha = -2.956$  and  $\beta = 0.5220$
- ▶ This returns the variance of the time series as  $10^{-2.956}$ .
- ▶ More importantly, 0.5220 is just above 0.5 which would correspond to a Brownian motion  $\sigma \propto 0.5$ , so that we know the auto-covariance for higher lags, is above the 'base level' we would expect on the null hypothesis of a Brownian Motion.
- ▶ Hence we conclude that there is some momentum effect in the market.

## Interpretation

- ▶ This time we have  $\alpha = -2.6994$  and  $\beta = 0.5220$
- ▶ So again, we conclude that there is some momentum effect in the market.

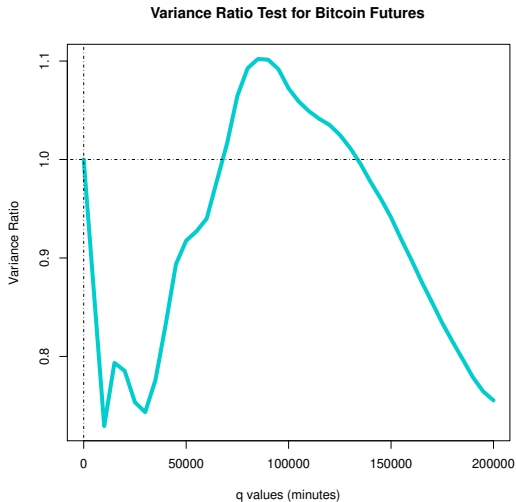

## Highlight summary

- ▶ The variance ratio tests that were conducted on the two futures markets; the value of  $q$  that was used ranged from 1 minute to 200,000 minutes. The tests produced the following results:
- ▶ Bitcoin initially produces a pattern of inefficiency of mean reversion. This pattern of inefficiency implies that agents over-react to new information by overselling if negative information is received or over-buying if good information is received. Both trends (overselling or over-purchasing) are later corrected by market agents by reversing the over-purchase or over-selling of BTC. A similar pattern is also seen in a previous experiment (Chekhlov, 2010) with other currency variance ratios, such as the Canadian and Australian dollar. However, it then appears to follow a Trend-following pattern.
- ▶ Soybean oil produces a trend-following pattern. By trend following, market agents under-react to new information, and establish a partial position, whilst awaiting confirmations from other market agents. When confirmation is received, these agents continue to increase their position in the same direction (buy or sell). This produces a delayed, chain reaction, wherein the new market information is slowly priced into the market.

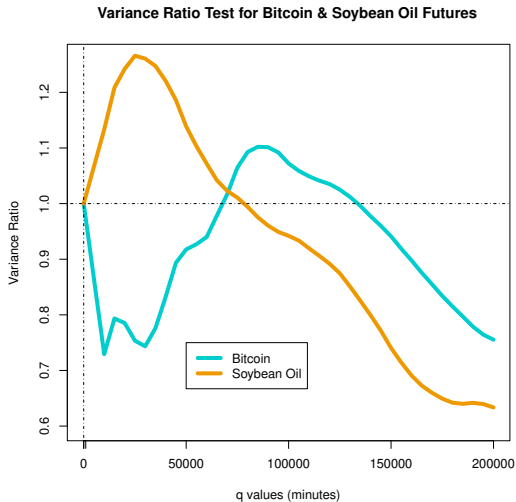

## Statistical performance soybean oil $T = 3, \tau = 3$

## Statistical performance soybean oil $T = 3, \tau = 3$

## Statistical performance soybean oil $T = 3, \tau = 3$

## How we did it

- ▶ We had originally written the trade code in Numpy but that's not fast enough. We ended up writing the trade code in C++ and compile it into a Python module using Pybind11. By that we achieved a 50-fold time reduction in the trade code itself, or 10-time reduction if we consider all the processing done in Python and C++.
- ▶ The trade parameters over 'Channel length' and 'Stop Percent' are optimised using an automatic hyperparameter (parameters in a learning algorithm) framework in Python. More will be explained later.
- ▶ To better use the limited computing power, multi-processing was also used to run the code in parallel.

# Pybind

- ▶ We wrote the trade code/function in C++ and compiled the code into a python package.
- ▶ The trade function is wrapped as below:

```
1 #include <iostream>
2 #include <vector>
3 #include <tuple>
4 #include <pybind11/pybind11.h>
5 #include <pybind11/numpy.h>
6 #include <pybind11/stl.h>
7
8 namespace py = pybind11;
9
10 // py::tuple<double, double, double> trade_cpp(py::array_t<double> df_array, double stop_per
11 std::tuple<py::array_t<double>, int, std::tuple< std::vector<int>, std::vector<double>, std:
12 trade_cpp(py::array_t<double> df_array, double stop_per, double slpg, double PV, double E0,
double init benchmarkShort*/) {
```

## Optuna

- ▶ We use Bayesian optimization implemented in Python package Optuna for hyperparameter selection (channel length and stop percentage), which sequentially tries out the most promising hyperparameters and is more efficient than grid search.
- ▶ Based on our experiments, using 1000 hyperparameter trials in Bayesian optimization can reach a similar performance level as compared to 90,000 hyperparameter trials in grid search.

## Multi-processing

- ▶ We use multiple processing parallelization to leverage multiple CPU cores in laptop to accelerate the computation
